

ACCESSION NR: AP4042116

of nitrogen in niobium, the mixture of α - and β -phases, and pure niobium have hole-type conductivity the proportion of which decreases with increasing nitrogen content. At a nitrogen content of 27.3 at%, the alloy conductivity is predominantly of the electron type; only in the region of δ' + δ phases does hole-type conductivity become again predominant. The composition dependence of resistivity and of the Hall constant is rather complicated (See Fig. 2 of the Enclosure). The composition dependence of density, thermal emf, and heat conductivity were also determined. Orig. art. has: 4 figures, and 1 table.

TITLE: Physical properties of titanium carbide in the homogeneity
region

SOURCE: AN SSSR. Doklady*, v. 157, no. 2, 1964, 408-411

TOPIC TAGS: titanium carbide, carbon deficient titanium carbide,
titanium carbide electrical property, titanium carbide electric
conductivity, titanium carbide semiconducting property

ABSTRACT: An investigation has been made in the 20—1200°C range of the time dependence of the specific resistivity and the coefficient of thermal emf of titanium carbide with a stoichiometric composition and also of carbon-deficient compositions, $TiC_{0.50}$ (87.3% Ti, 12.47% Cfix), $TiC_{0.72}$ (84.3% Ti, 15.3% Cfix), $TiC_{0.81}$ (82.4% Ti, 17.1% Cfix), and $TiC_{0.988}$ (79.8% Ti, 19.6% Cfix, 0.4% free C). The Hall coefficient and magnetic susceptibility have also been measured at room temperature. The specific resistivity at room temperature was found to decrease from 174 to 52.2 ohm·cm as the titanium carbide approached

Card 1/3

ACCESSION NR: AP4042211

the stoichiometric composition. The Hall coefficient increased from $-4.0 \cdot 10^4$ to $+6.7 \pm 0.2 \cdot 10^4 \text{ cm}^3 \cdot \text{coul}$. The Hall coefficient and thermal emf, which varied from -7.7 ± 0.2 to $+12.5 \pm 0.2 \text{ mv/degC}$, were both of the same sign and changed analogously with increasing carbon content. The magnetic susceptibility per unit mass, varying from $3.0 \pm 0.1 \cdot 10^{-6}$ to $3.22 \pm 0.36 \cdot 10^{-6}$, remained almost unchanged and practically equal to that of pure titanium, i.e., $3.2 \cdot 10^{-6}$. The charge carrier mobility increased quite sharply from 2.3 to 12.8 $\text{cm}^2/\text{v} \cdot \text{sec}$ as the titanium approached the stoichiometric composition. The negative values of the Hall coefficient and thermal emf indicate a predominantly electron conductivity in the entire homogeneity portion of the carbide studied. The relative contribution of electrons to electric conductivity increased on approaching the stoichiometric composition, with a particularly sharp increase in the region of 46—50 at% C. The increasing electric conductivity with increased carbon content observed can be explained by the higher mobility of conductivity electrons. The experimental data show the metallic nature of the electric conductivity of titanium carbide with stoichiometric and nonstoichiometric compositions in

Card 2/3

ACCESSION NR: AP4042211

the entire temperature range investigated. The data indicate no possibility of the appearance of semiconductor-type conductivity in the titanium carbide investigated. Orig. art. has: 4 figures and 1 table.

TITLE: Temperature dependence of thermal emf and the specific resistance of titanium, vanadium, and chromium and their borides, carbides, and nitrides

SOURCE: AN UkrSSR. Institut problem materialovedeniya. Vysokotemperaturnyye neorganicheskiye soyedineniya (High temperature inorganic compounds). Kiev, Naukova dumka, 1965, 100-107

TOPIC TAGS: thermal emf, titanium, vanadium, chromium, boride, carbide, nitride

ABSTRACT: The temperature dependence of thermal emf and specific resistance of Ti, TiB_2 , TiC , TiN , V, VB_2 , VN , VC , Cr, Cr_4B_2 , CrB_2 , $Cr_2_3C_6$, Cr_7B_3 , Cr_3B_2 , Cr_2N , Cr_3C_2 , and CrN were investigated in the 20° - $1200^\circ C$ range. The pure metals were over 99.9% pure. The specific resistance (ρ) and the coefficient of thermal emf (E_T) were measured in a special vacuum furnace ($2 \cdot 10^{-4}$ - $8 \cdot 10^{-5}$ mm Hg). The temperature dependence of ρ for Ti- and V borides, carbides and nitrides and Ti and V, and Cr and its

Termika morya. Khimiya morya (Thermal Regime of the Sea. Chemistry of the Sea) Moscow, AN SSSR, 1958. 145 p. (Series: Its: Trudy, tom 13) Errata slip inserted. 1,300 copies printed.

Resp. Ed.: A.G. Kolesnikov, Doctor of Physical and Mathematical Sciences; Ed. of Publishing House: L.K. Nikolayeva; Tech. Ed.: N.F. Yegorova.

PURPOSE: This collection of articles is intended for geophysicists, hydrophysicists, and oceanographers.

COVERAGE: These articles deal with problems in the physics and chemistry of sea water. Individual papers treat the turbulent thermal conductivity and heat exchange in sea water, the pulsations in air temperature, the salinity of the Black Sea, the determination of calcium, magnesium, and copper in sea water, and the determination of sodium in atmospheric precipitates. Figures, tables, and graphs accompany the articles. There are 121 references: 92 Soviet, 18 English, 8 German, 2 French, and 1 Swedish.

TITLE: The Thermobattery for Measuring the Temperature Fluctuations
of the Air

PERIODICAL: Tr. Morsk. gidrofizich. in-ta AS USSR, 1958, Vol 13, pp 73-77

ABSTRACT: The manufacture of a differential thermobattery (TB) by the well-known galvanic method is described. The author proposes an original device for determining the time constant and estimating the TB-sensitivity; the functioning of the device is based on the principle of the adiabatic heating of an isolated gas volume being compressed instantaneously. The rapid compression of the gas volume, which is enclosed within a glass receiver having a volume of 350 cm³ and sealed by a rubber diaphragm, is realized by a special striker hitting sharply against the diaphragm. A system of electric contacts record beginning and end of the stroke. The TB records the temperature increase. The POB-12 galvanometer oscillograph

28

Card 1/2

SOV/169-59-7-7092

The Thermobattery for Measuring the Temperature Fluctuations of the Air

registers the processes. Examples of oscillograms are added. Theoretical calculations of the sensitivity of the TB are carried out for comparing the theoretical and experimental data; the results of the comparison are tabulated. The author draws some practical conclusions on the reasonable selection of the parameters of the TB.

TITLE:

Electrical properties of titanium carbide-titanium
nitride alloys

PERIODICAL:

Ukrayins'kyy fizychnyy zhurnal, v. 7, no. 3, 1962,
331 - 334

TEXT:

The resistivity ρ , Hall coefficient R, thermo e.m.f. τ and the thermal coefficient of resistivity α of the system TiC-TiN, were measured. The study of the electrical properties of TiC-TiN alloys is important for ascertaining the influence (on these properties) of the relative concentration of C and Ni atoms (found in the same type of lattice) with different ionization-potential (11.24 and 14.51 ev., respectively). The alloys were prepared from powder mixtures, by hot pressing. The measurements were conducted by a method, given in the references. The obtained results are listed in 2 tables, together with the values of the effective concentrations n and the mobilities u , calculated by the pertinent formulas. The negative sign of the Hall coefficients and of the

Card 1/3

Electrical properties ...

S/185/62/007/003/013/015
D299/D301

thermo e.m.f. shows that n-type conductivity prevails in the investigated alloys. Substitution of the C-atoms by Ni atoms is accompanied by a decrease in effective carrier concentration. The resistivity curve of the TiC-TiN alloys is non-monotonous, reaching its maximum at a concentration of 25 mol. % TiC (which is in agreement with theory). The increase in resistivity with TiC concentration, can be explained by the scattering of electrons by the carbon atoms, which can be regarded as impurity centers. This is confirmed by the concentration curve of ... The effective carrier-mobility in TiC is higher as compared to that in Ti, whereas the effective concentration is lower, owing to hybridization of 4s-electrons of Ti and 2p-electrons of C. The change in magnetic susceptibility follows that in carrier concentration. The conclusion is reached that (in the alloys under consideration), the principal carrier are the 4s-electrons of Ti with a small contribution by holes of the 3d-band in TiC, and a greater contribution of holes -- in TiN; the carbon and nitrogen are mainly acceptors of 4s-electrons. There are 2 figures, 1 table and 11 references: 9 Soviet-bloc and 2 non-Soviet-bloc.

TITLE: The Nernst-Ettingshausen effect in titanium, its diboride, carbide, and nitride

SOURCE: Ukrayins'kyi fizichnyi zhurnal, v. 10, no. 7, 1965, 805-806

TOPIC TAGS: Nernst effect, titanium, conduction electron, electron mobility, electron scattering, phonon scattering

ABSTRACT: The Nernst-Ettingshausen coefficient is obtained for titanium and its diboride, carbide, and nitride. The concentration of conduction electrons, the mobility, the Fermi energy, the effective mass of the electrons, and the relaxation time are determined for TiB₂ under the assumption of a spherical Fermi surface, a weak magnetic field, and under the assumption that one scattering mechanism predominates employing a one-zone model. The samples were rectangular in shape. A temperature gradient of 20--30 °C/cm was maintained. The magnetic field in the gap was 12,000 Oe. The Nernst-Ettingshausen voltage was measured with a PPTN-1 potentiometer with an electrophotooptical amplifier. The experimental results lead to the following values for TiB₂: concentration of conduction electrons -- $3.5 \times 10^{21} \text{ cm}^{-3}$, mobility -- $12^4 \text{ cm}^2/\text{v-sec}$, $r = -0.56$, Fermi energy -- 0.33 eV, effective mass -- $0.26 m_e$, re-

Card 1/2

L 00533-66
ACCESSION NR: AP5018640

laxation time -- 1.8×10^{-14} sec. Thus the criteria of strong degeneracy of current carriers and the weakness of the magnetic field are well satisfied. The value of $r = -0.56$ is close to $r = -0.5$ for scattering by acoustic oscillations. The results obtained for TIB₂ are sensible and indicate that the initial assumptions are acceptable. "The authors express their gratitude to V. S. L'vov for participation in a discussion of the obtained results." Orig. art. has: 1 figure, 6 formulas, and 1 table.

TITLE: Investigation of the operation of a capacitor bank with stored energy ^f 625 kJ
using a physical modelSOURCE: AN UkrSSR. Magnitnyye lovushki (Magnetic traps). Kiev, Naukova dumka, 1965,
147-156

TOPIC TAGS: electric network, test model, electric capacitor, differential equation

ABSTRACT: The authors describe a model constructed to simulate the low-inductance capacitor bank described in a companion paper (Acc. Nr. AT6008853). The equivalent circuit of the battery consisted of 99 reactive elements, so connected that the order of differential equations to be solved is reduced to 29. The purpose of the test was to check whether the capacitor bank is correctly connected (the switching elements installed in the proper places), to determine the voltages that can occur in the capacitor-bank elements during normal and emergency conditions, and to assess the effect of different lengths of the interconnecting cables on the operation of the bank. Low-voltage capacitors (KBG, KSO, and KTK) were used in the model. The coaxial cable was replaced by artificial lines with lumped constants. Tables showing the characteristics of the different circuits and oscilloscopes showing the results of simulated transient tests are presented. The emergency conditions simulated were a short circuit

Card 1/2

ACC NR: AT6008854

of the load, a short circuit of the cable during the charging of the capacitor bank, and a short circuit of one capacitor at nominal charging voltage. The tests have shown that the increase in the current of individual capacitors occurring under the abnormal conditions does not exceed the safety factor incorporated in the design. Orig. art. has: 5 figures, 5 formulas, and 2 tables.

TITLE: Photoelectric Emission of the Systems W-BaO and W-Ba

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 11, pp. 2805-2812

TEXT: The authors' aim was a comprehensive investigation of the photoelectric properties of the W-BaO and W-Ba systems, a comparison of the properties of these two systems, and a study of the nature of the photoeffect of these systems. First of all, the measuring method is described, Fig. 1 gives a schematic representation of the device working in plane geometry. Figs. 2 and 3 show typical spectral characteristics of W-BaO systems. On the whole it could be observed that the quantum yield increases monotonically with the layer thickness. In the series of measurements illustrated in Fig. 3, however, this was not the case, which may be explained by the somewhat less favorable vacuum conditions. The work function of the tungsten backing ($10 - 25\mu$) measured by the Fowler method was found to be $4.3 - 4.4$ ev, whereas the Richardson method yielded a value of $4.5 - 4.6$ ev. The yield curves were evaluated according to Fowler, and the

result (Fig. 4) is discussed. The spectral characteristics of the photo-emission of the W-Ba system take a similar course as those of W-BaO. It is, however, partly smoother and without any noticeable connection between quantum yield and layer thickness. Figs. 5 and 6 show the characteristics; those shown in Fig. 6 were recorded at a much lower rate of sputtering. Fig. 7 shows the Fowler curves which take a similar course as those of the W-BaO system. Summing up: 1) An investigation was carried out of the change in the work function (Fig. 8 shows the work function as a function of the sputtering time on a cold backing) and of the quantum yield for a thickness from 0 to 3 - 10 monomolecular layers (Figs. 2-6). 2) The spectral characteristics of the photoeffect of W-Ba are largely monotonic up to a thickness of about 10 monomolecular layers, except for a thickness of about one layer, where the characteristic takes an anomalous course. 3) The spectral characteristics of the system W-BaO showed no peculiarities for a thickness of less than one monomolecular layer, and in photoemission the photoelectrons of the metal with reduced work function play the main part. 4) For BaO coatings on a W-base with a thickness of more than one monomolecular layer, the quantum yield curves show peculiarities which cannot be ascribed either to the properties of the W-backing nor to BaO. Thus, BaO coatings of a thickness of one or several molecules

TITLE: Spectral characteristics of the W-BaO system in polarized light

PERIODICAL: Fizika tverdogo tela, v. 3, no. 11, 1961, 3529-3531

TEXT: The photoactivity of the system W-BaO was measured in polarized light on barium oxide evaporated onto a tungsten film (99.95% W, 0.029% Mo), and the temperature time dependence of the spectral characteristics were determined. The specimens were heated to 1200°K and the measurements were made with a glass-prism monochromator with a dispersion of 2 to 6 μm at 2 to 3 ev. Light from a filament lamp was polarized by МИИ-8 (MIN-8) filters. Light rays from the monochromator were directed onto the target of the vacuum tube at an angle of 45°. Vacuum pressure was not more than $5 \cdot 10^{-9}$ mm Hg. Distinct polarization selectivity was found for BaO films from 0.7 to about 4 monolayers thick. The quantum yield of the photo-current in natural light is mainly determined essentially by the light

30798
S/18/61/003/011/044/056

Spectral characteristics of the W-BaO ... B104/B138

polarized in the plane of incidence. The polarization selectivity of BaO films of about 3 monolayers has a maximum around 3 ev, which shifts to about 2.6 ev after 2 min heating at 1200°K, when an increase in photo-activity is also observed. Longer heating causes "stabilization" of photo-activity (Fig. 2). The $\gamma_{||}/\gamma_{\perp}$ ratio (where γ is the quantum yield) is greater than 3 and sometimes as much as 10. No explanation could be found for the spectra maxima of the quantum yield. They are assumed to be related to structural changes. Professor A. R. Shul'man is thanked for his interest. There are 2 figures and 4 Soviet references. X

TITLE: Photo- and thermionic emission characteristics of the copper-barium system

SOURCE: Fizika tverdogo tela, v. 6, no. 6, 1964, 1854-1856

TOPIC TAGS: photoemission, thermionic emission, copper alloy, barium alloy, work function, quantum yield

ABSTRACT: The photo- and thermionic emission characteristics were investigated for the system $Cu_x - Ba_y$ where in the samples used $2 \leq x \leq 10$ and $y = 1$. The samples were prepared by evaporating a layer of copper onto a tungsten backing, followed by a layer of barium, or vice versa and then heating. The emission characteristics depend primarily on the deposition sequence of the components on the tungsten backing. The photoelectric work function for samples with barium on copper as a function of temperature remained fixed at ~ 2.6 ev up to 700K, went through a minimum reaching ~ 1.9 ev in the region 700-1100K, then rose roughly linearly to ~ 4.5 ev at ~ 2000 K. At 800 and 1000K the thermal emission current was $1.5-2 \times 10^{-5}$ and 1.5×10^{-3} a/cm² respectively. These results were very

Card 11/2

ACCESSION NR: AP4039680

reproducible and were practically independent of the initial thickness of the barium layer. The spectral characteristics of the quantum yield were determined for samples with copper on barium as a function of the heat treatment. It was found that after heating the samples to 900K there was a definite stabilization of the spectral response level in the region $h\nu \approx 3 - 5$ ev. From these measurements the surface photoelectric work function was 3.0 ev. The authors thank A. B. Shul'man for his interest in the work. Orig. art. has: 2 diagrams.

TITLE: Emission properties of the gold-barium system

SOURCE: Radiotekhnika i elektronika, v. 9, no. 4, 1964, 761-762

TOPIC TAGS: gold, barium, gold barium system, gold barium cathode emission, gold barium intermetallic compound, gold antiemission property, work function

ABSTRACT: The effect of the heating temperature on the thermionic and photo-emission properties of the gold-barium system was investigated in order to obtain data on the antiemission properties of gold. The experimental technique was described elsewhere (A. R. Shul'man, M. L. Kapitza, R. L. Nemchenok, Ye. V. Zelenetskaya, Fizika tverdogo tela, 1960, v. 2, no. 11, 2805). The tests show that in the temperature interval 950-1200 K the evaporated substance is essentially gold. Starting with 1200 K, the evaporation of the Au-Ba layer as a whole begins. The temperature variation of the work function, as obtained from the photoemission data, differs from that obtained from thermionic emission measurements, (see Fig. 1 of Enclosure). This may be due to the evaporation of the

Card 1/3

ACCESSION NR: AP4038633

"excess" gold and formation of an intermetallic compound which evaporates at higher temperatures, when both work functions stabilize at approximately the value of the work function of gold. "The authors are grateful to A. R. Shul'man for valuable advice and interest in the work." Orig. art. has: 2 figures.

on the Development of Potato Rhizoctoniosis in Moldavia.

Orig Pub : Uch. zap. Kishinevsk. un-ta, 1956, 23, 123-132.

Abstract : The study was conducted in Kishinev University on the effect of dates (1st and 12th of April) of planting potatoes, the depth of tuber plantings (12, 16, 20 and 24 cm), vernalization and combinations with bacterial fertilizers as to the development of rhizoctoniosis. The experiments were conducted with Octyabrenok, Yubel and Courier varieties. In addition a study was made on the influence of irrigation on destruction of 16 potato varieties. During the period of winter storage in a storeroom and in trenches for formation of scleroses Rhizoctonia solani Kubn was observed

Abstract : on potato bulbs of the Courier variety. The investigation proved that the disease is developed in spring sowings of potatoes independently of agrotechnical conditions. The interaction of the mold with the host plant had a specific character. The mold would settle on the underground part of the stalk and on the roots; however, the plants developed normally and the crop of tubers was not diminished. The prevalence of scleroses in the tubers was higher when potatoes were stored in trenches with a covering of soil, than by keeping them in storerooms.

in the Turf-Podzolic Zone

Orig. Pub. : Sb. robot Tsentr. muzeyna pochvoved. AN SSSR,
1957, vyp. 2, 57-101

Abstract : The interlinking of sod, podzol and bog formation
processes has been observed in the poorly drained
regions of the turf-podzolic zone, where the in-
crease in soil podzolization and bogging is caused
by intensification of the anaerobic restorative
processes in the soil and by increased action of
base-saturated organic acids. The change from the
sod formation process to bog formation is accom-
panied by an intensification of the restorative
processes, which also produce an accumulation of
organic matter in the soils. The humification of

Conveyor in an aircraft

conveyor belt, which moves at 0.6 m/sec in both directions, can take a maximum load of 400 kg. The maximum load which can be placed in one part of the belt is 120 kg. A ГСК -1500 (GSK-1500) motor operating on d.c. current is used in the driving section. The individual parts of all four sections are described. By placing special plates on the belt, up to 1000 kg load can be placed over the entire length of the conveyor. The conveyor can be switched on and off from a control point fixed on the inner wall of the baggage compartment near the hatch. Two loaders are used; the first one takes the load at the hatch and places it on the conveyor belt. It also directs the belt to the required side. The second loader removes the load from the belt and places it in empty spaces in the baggage compartment. The electric motor of the conveyor can be fed from battery carts, ЭК -2 (EK-2) power trucks or ТА -1 (TA-1) and ТА -1 М(TA-1M) tow cars. The two experimental models were installed on Tu-104B and Il-18 aircraft and tested at Vnukovo Airport. Both successfully passed the tests. It was shown that three loaders took

Title : Treatment of Sheep with Carbocholin and Proserin in Postparturient Disorders

Orig Pub : Tr. Buryat-Mong. zoovet. in-ta, 1957, vyp. 11, 171-174

Abstract : For the treatment of endometria, carbonholin* (C) was administered subcutaneously in the region of the internal surface of the hip or behind the elbow projection as a 0.01% solution, in a dose of 2 ml. once a day, during 2-3 days. In case of an incomplete cure, the course of treatment was repeated after 2-3 days. In case of retained afterbirth, C was administered in the same dose at an interval of 4-6 hours between injections, not more than 2 injections during a day. In primary weakness of contractions, P was introduced in a single dose of 2 ml. of 0.01% solution. Proserin** (P)

TITLE:

Calculating the effect of dissociation and ionization of air in certain problems of gas dynamics

PERIODICAL:

Referativnyy zhurnal. Mekhanika, no. 10, 1961, 20-21, abstract 10 B111 (Tr. Mosk. fiz. tekhn. in-ta, 1958, no. 1, 173-189)

TEXT: A scheme is introduced for calculating the effect of excitation of the internal degrees of freedom and also of ionization and dissociation on a flow with shock-waves at high Mach numbers. In view of the great difference in heats of reaction of the dissociation of O₂ and N₂, and neglecting the form NO, the author defines a region of comparatively low temperatures where O₂ dissociates in the presence of N₂, a region of much higher temperatures where N₂ dissociates in an atmosphere of atomic O, and finally, a

region where the ionization of the monatomic gases takes place.
The variation in pressure, temperature and angle of leap in dependence on the Mach number is calculated for the equation of state of an ideal gas. The adiabatic motion of the gas is also considered.

TITLE: Approximate determination of gas parameters behind a shock-wave front according to the law of shock propagation

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 4, 1963,
58-67

TOPIC TAGS: shock wave, shock front, shock-wave propagation, Lagrange coordinate, Euler coordinate, linear extrapolation, strong explosion, back pressure, heat transfer, radiative de-excitation, bremsstrahlung, integral-correlation method

ABSTRACT: A method is outlined for approximate determination of gas parameters behind a shock-wave front according to the known law of shock-wave propagation. The method, based on calculation of basic derivatives of gasdynamic parameters at the shock-wave front in Lagrange's coordinate system, is similar to that of L. I. Sedov for calculation of derivatives in Euler's coordinates. It consists in the linear extrapolation of pressure along the mass of gas in motion with
